**Description**

New instance, will be available to the public (AutoSetupUsers: true).

Will run Arvados 2.0 testing repository (so we can use it to test release candidates).

Set up on AWS.

Suggest distributing services across 4 VMs like this to minimize costs:

- api: postgres, api server, git, websockets, arvados-cloud-dispatch
- workbench: keepproxy, keep-web, workbench, workbench2
- keep0: keepstore
- shell: shell

Should be a scripted install, use devops tools to create and provision the VMs. Make scripts reusable, we want to distribute them as a one-click install.
